

Agreement Is All We Need.

The OMI Portal Manifest & Request for Collaboration.

A decentralized protocol for defining boundaries
before corporations enclose the physical world.

The Enclosure of the Analog.

[STFR1001A DATA] [COMMAND EXECUTION]

- > The next generation of digital systems extends beyond screens into homes, streets, sensors, and autonomous swarms.

[STFR10092 DATA] [COMMAND EXECUTION]

- > If we do nothing, the largest corporations and private platforms will dictate the boundary between the physical and the digital.

[STFR200E7 DATA] [COMMAND EXECUTION]

- > A camera frame, a LiDAR scan, or a robotics adapter signal should not automatically become truth just because a platform says so.

[TECNICAL SPACE INTERNED]

[OWINAST:1:1:]

We are not waiting for corporations to decide the next digital boundary. We are defining it first.

The Flawed Paradigm

The app owns the object.

```
prefix → identity  
gossip → authority  
render → believe
```

The OMI Doctrine

```
carrier != authority  
projection != validation  
prefix != identity  
gossip != authority  
render != believe
```

Projection can help a person read an object, but projection cannot validate the object. OMI rejects the shortcut of absolute truth.

Agreement Before Evaluation

Lambda - The Old Way

A normal function evaluates its operands before receiving them. It computes values blindly.

A declaration enters the frame.
A transition resolves. A receipt records.
A materializer applies.

Fexpr - The OMI Way

OMI receives declarations unevaluated. It holds them as candidates to control evaluation.

Technical Blueprint Manifesto

The reader may recognize. The resolver may promote.
Only validation and receipt may accept.

$$Q_{xy}(x,y) = 60x^2 + 16xy + 4y^2$$

Schläfli, Betti, and the Projective Variables.

Schläfli	$\{p, q, r, s\}$	= incidence grammar (the body)
Betti	$[\beta_0, \beta_1, \beta_2, \beta_3]$	= topological memory (the holes)

(LL, NN, MM)

- LL** = scoped ray / ket selector 
- NN** = ray origin / antecedent state 
- MM** = ray hit / resolved state 

Omi-Clock:
241-LED circular array
(projects time/state).

Omi-Dome:
24-inch sensory
enclosure shell.

Omi-Observer:
The browser
portal acting as
witness.

Omi-Base:
Rotating
synchronization
platform.

Omi-Gnomon:
7-bit tetrahedral
block controller
(orients).

Omi-Clock:
241-LED circular array
(projects time/state).

**THE HARDWARE DOES NOT
REPLACE THE OBJECT.
THE HARDWARE PROJECTS IT.**

THE PYRAMID ENCODER

THE AMULET DECODER

Node A (Omi-Dome Core):
The root boundary.

Node B (Sensory Actor):
Collects IMU, light, sound.
Sends events.

Node C (Peer Witness):
Third-party relay.
Compares state.

>_ THE CANONICAL PROOF STACK

Tier 1:
ESP32-S2 proves
physical open-wcld
sensing.

Tier 2:
Browser serves as
the Omi-Observer
projection.

Tier 3:
VPS services
handle semantic/
geometric routing.

Tier 4:
QEMU/NBD
provides reproducible
replay.

THREE ESP32S PROVE THE WORLD. TO PROVE THE WORLD.
TWO VPS ROUTERS ROUTERPRETS INTERPRIET THE WORLD. THE BROWSER
OBSERVES THE WORLD. THE RECEIPT ACCEPTS THE WORLD.

Experience:
Remembers.
(What happened?)

Focus:
Selects the object.
(What is this?)

Observation:
Verifies.
(Why should I trust this?)

Attention:
Alerts.
(What changed?)

The protocol is mathematical; the interface is human.
OMI is an object workspace, not a protocol dashboard.

>_

These **12 principles** **orient** the relation. They act as **routing sectors, agent policies, and ui quadrants.**

[The 12 orient.]

[The 9 prove.]

[The receipt accepts.]

The Fractal Architecture of Agreement.

[A **local structure** may appear as Frame/Group/Relation, Red/Green/Blue, or Component /Loop/Void. They are **different lenses** over the exact same bounded agreement object.]

Why This Cannot Belong to One Person.

The protocol is not a throne.
The protocol is a table.

>_

[This protocol is **too powerful**
for one person to possess.]

The boundary between **analog**
environments and digital systems
is where **future value, control,**
surveillance, and **robotics** will
be negotiated.]

>_

[No corporation should close it
before regular people understand it.]

>_

[No millionaire should get the
first version just because they
can buy the hardware faster.]

A Request for Collaboration.

Tier 2 (\$1,000) — 2.5D Tabletop World

[Omi-Clock, sensor nodes, LoRa
test layer, wall browser.]

Goal: Tabletop environment synchronizes
with pseudo-persistent world.

Tier 1 (\$250) — 2D Boundary Proof

[ESP32 nodes, browser portal,
basic robotics adapter.]

Goal: One physical event becomes a
receipted browser object.

Tier 3 (\$10,000) — 3D Open-World Lab

[
LiDAR, multi-node ESP32
mesh, edge compute, 3D
WebXR receipt replay.]

Goal: Full spatial prototype
where hardware events become
bounded, receipted state.

>_

[ESP32 nodes, browser portal,
basic robotics adapter.]

Goal: One physical event becomes
a receipted browser object.

Agreement is the accepted,
receipted transition from
transition from **declaration**
to inspectable object.

OMI turns open-world
declarations into bounded,
validated, replayable, and
inspectable agreement.

Analog environments surround us.
Digital systems increasingly interpret them.
Boundaries decide power. Constraints decide freedom.
Receipts decide acceptance.

Join us in building OMI Portal before the next generation
of digital boundaries is enclosed by private platforms.

AGREEMENT IS ALL WE NEED.
