

Agreement is Structural: The OMI Object Model

[A bottom-up architecture bridging kernel-level mathematics and open-world consumer portals.]

Closed-World Silo

Result

Absolute Lock-in. Disagreement means deletion or moderation.

OMI Open-World Portal

Result

Portable Context. Disagreement is an inspectable path.

Agreement is all you need because agreement is the bridge from open-world uncertainty to validated shared structure.

The Atomic Anchor: omi---imo

Every valid transmission is exactly 128 bytes, bounded by these escape sequences.
Without these anchors, frames are rejected pre-parsing. Inverting the stream flips the processing matrix.

Network Native: The /48 Canonical Overlap

The 128-bit width embeds OMI directly into standard internet infrastructure.

A /48 prefix locks the upper 3 segments, leaving the remaining 5 free for internal addressing machinery.

The Spatial Engine: The Quadratic Law

$$60x^2 + 16xy + 4y^2$$

$60x^2$ (High Plane)

Sexagesimal spatial orientation.
Maps to DOM `id`. Stable identity.
Ensures infinite subdivision
without fractional truncation.

$4y^2$ (Low Plane)

Localized atomic data. Maps
to DOM `data-\*` attributes.

$16xy$ (The Bridge)

The active execution matrix
where the planes meet.
CSSOM/JSDOM execution layer.

[Validation Logic: $Q(x,y)$ serves as a structural checksum. Mismatch = dropped frame.]

The Temporal Engine: The Delta Law

Rotations

Never shift, no bits are ever lost.

Constant C (0x5A3C)

Breaks the zero fixed point, ensuring the orbit always moves.

The Period-8 Property:

Any initial state returns to itself after exactly 8 steps.

This mathematically aligns with the 8 16-bit segments of the canonical OMI frame.

XOR ($\oplus$)

Fully reversible state transitions.

Fano Intercept

Any trajectory through the law converges in ≤ 15 steps via projective geometry, terminating at Gate 2.

The eBPF Kernel Gate: Hardware-Level Validation

~14.7 KB
compiled object

JITs to ~1.5 KB
native code

0 false positives.
Bare-metal NIC driver speed.

The Winding Ledger: The 5040-Slot Memory Ring

Overwrite Policy Matrix			
1	Cold Slot	<code>existing_epoch < current</code>	Overwrite permitted
2	Warm Slot	<code>existing_epoch == current, Q(S)=0</code>	Drop new frame (slot active)
3	Corrupt Slot	<code>existing_epoch == current, Q(S)≠0</code>	Overwrite permitted (reclamation)

The Meta-Circular Chronograph

The **128-byte instruction** is written in its own language.
The same **arithmetic** validating the frame IS the frame.

The Three Identities of a Frame

1. Code

A valid instruction
processed bare-metal
through **Gates 1 & 2**.

2. Directive

A compiler parameter
modifying how subsequent
frames are processed.

3. Data

A receipt stored in the
ring indexer, queried by
provenance.

The **Chronograph Engine** ticks forward based on orbital distance traveled through the **Delta Law** state space (**Stride W=36**), rather than wall-clock time. **Time is geometric.**

Wormhole Portals & DOM Register Gates

The Synthesis: Object Agreement Pipeline

The user clicks a button; the protocol proves the physics.

The Dual Consumer Views

Linear View (Time / History)

What happened? What led to this state?

omi -> payload -> imo

Hierarchical View (Space / Containment)

Where does this belong? What contains it?

FS -> GS -> RS -> US

[Note: Both views are generated dynamically from the exact same mathematical receipt ring.]

Disagreement is Missing Structure

Question		Diagnosis	Resolution
What is this?		Missing boundary	Reveal object address
Who said this?		Missing source	Show provenance object
Why trust it?		Missing receipt	Show validation evidence
Which version is current?		Missing conflict rule	Show competing receipts

**The portal does not erase disagreement.
It routes disagreement into inspectable structure.**

Open World, Safe Projection

**carrier is
not authority**

**projection is
not validation**

**visual trust is
not proto trust**

Safety Cascade

Implementation Rules

Sanitize
innerHTML

Isolate
ShadowDOM
capsules

Strictly separate
the display layer
from the $Q(S)=0$
validation layer

The Genesis Frame

$Q(S) = 0$
(Perfect Stability)

$\delta(0x7C00)$
resolves in 1 step

Anchored at
slot 1504

[0100-03bf-7c00-2b01-2f01-1434-039f-01ff]

The relation bridges. The object closes. A world can begin.
